

Assignment 1

Date: Feb 2020
Version 1.1

Class: PCB06

Student number: 4449681

Student name: Sergio Pizzella

Examples of AI

Google maps routing

The google maps directions tool is one that I use almost every day, particularly since I recently came to live in the Netherlands. I like that it allows me to move around the city and get to where I need to go in a fast and quick manner, without having any knowledge about the city. My experience using the tool through the google maps app has been great.

On the other hand, when I use the tool through my work application, the AI does not provide me with the quickest routes and lets me travel longer distances for no visible reason. At times, it shows 3 options out of which one is certainly shorter, yet it still selects the longer one. Some other times it does not even show the shortest route as an option.

Netflix recommendation's

One of my favourite activities is to watch movies and shows, thus a problem I frequently run into is that I do not know what to watch. The Netflix recommendation AI comes in handy in these situations and allows me to find fun and interesting shows to get hooked on.

On the other hand, despite trying to train the AI as much as possible by liking and disliking every show I have watched, it still tends to recommend me shows I have no interest in and often, shows I have already watched and rated.
